# Introduction

- Web integration is the simplest, quick and easy way to integrate the Paylogic's PG in your Website. When using this mode of integration customers will be redirected from your checkout page with Server to Server communication to collect payment details which has built-in support for Saved Cards, Credit and Debit Cards, UPI & wallets.
- Paylogic's Servers which are PCI DSS compliant so that the merchant does not have to worry about the PCI DSS and do seamless mode of transaction without any hassle.
- Accept payments from your customers in a secure and quick manner with Paylogic. Your customers get a streamlined flow with the 'Checkout' form for initiating payments. The payment details shared by your customer are tokenized by Paylogic tag as data attributes. You can submit additional fields, visible or hidden, along with the form.
- With this sample code given, Paylogic "Checkout" options will be passed as the HTML data attributes. After the completion of the checkout process, an additional field `<name=id>` will be added to the form containing the script tag. Post this, the form is submitted automatically. With the authorization of the payment made, the form along with the `Paylogic_payment_id` to the action URL.

# Process Flow

This section briefly details the overall transaction flow –

- User logs-in at the Merchant website for Online payment
- User then decides to pay; clicks on 'Checkout' option provided at the merchant page
- Merchant website generates a unique reference number; along with other mandatory parameters and then converts it in to Json String.
- After generating the json object merchant encrypts the data using AES-256 algorithm. It provides a unique key for the data encryption. After encrypting the data merchant establish a connection with the 's Payment Gateway Interface over a secured https channel.
- At the Payment Gateway; User is displayed various 'payment options' that he can use, for e.g. Net Banking.
- User chooses the payment option at 's Payment Gateway and is taken to the page of that specific bank. User then enters the relevant authentication details [i.e. User ID/ Card Number/ Password etc.] at the bank's authentication page.
- User's account is debited, and the User is then directed back to the designated Return URL [RU] at Merchant website. encrypts the data (using the same key) before sending it to the merchant's page.
- After getting the response, merchant needs to decrypt the data. Merchant can use this response to update its system and display to the User that the payment process was successful
- Each request also generates a unique Transaction ID against each transaction that is received – this could be displayed to the User; and used for any queries relating to the transaction.
